

PlaySpec Sanitizing Service

PlaySpec offers this sanitizing service to our customers as an additional precaution to the current situation in our region. UV light has always been the best defense in killing viruses and harmful bacteria, but we know that some customers are concerned with areas that could be shaded on the playground which could possibly contain germs.

Sanitizing is used for the reduction of germs and viruses on inanimate surfaces to levels that are considered safer for children to be in contact with

We do not pressure wash any area with sanitizing agents and will temporarily suspend pressure washing since there is a theory that the mist caused by the high pressure could spread the viruses and put our employees at more risk.

Sanitizing uses a lower level of disinfectant that will decrease any effects on the objects that they are used on and also cause no harm to anyone coming in contact with the surface during or after the sanitizing process

Our sanitizing guns mix small amounts of non-scented bleach with common tap water and we will sanitize your entire playground area thoroughly. Concentrating on under sides of components and surfacing in shaded areas mostly.

Contact us for individual or group pricing! Prices will be based on availability of water at your location as well
